You can then use the new new Clipping to quickly remove unwanted people from crowded photos (among other uses). And then throw to by using the new image corrections that will help make your images look better. These include the new blur tool that is a type of smart blur tool. The new sharpen tool is another type of smart sharpening tool, although it does this by removing some color. New presets and adjustments will help you get the best out of it. We have also added an Undo function to all pen tools, so you can still adjust images if you accidentally do something you don't want to. Photoshop does one thing really well, and it's called masks. They are, we think, the easiest tool in the entire program to use. You can create layer masks, which you can use to hide and show different parts of an image, for example you could use a mask to hide an image that was superimposed over another photo. You can get to it by going to Image > Adjustments > Camera Raw. There are filters for presets such as Monotone, Fade to Black,

Muted, Stylish, Concave and so on, and a brand new Tone Curve option. You can also reload a preset about to save, and then use the Adjustment Brush to add the filters that best work with your image. Then import your images and perform the tweaks that will make them look better. There are also new blurs and sharpen tools. All of this will be shown in the new workspace that, again, you can access from the advanced Photoshop section.
